

# USING DATA-DRIVEN DECISIONS TO IMPROVE OPERATIONS

A well-thought-out plan for collecting, integrating and presenting manufacturing data can help drive business improvements.

By Richard Phillips, Manufacturing Intelligence Product Manager, Polytron, Inc.

**>>** Manufacturing Intelligence (MI) projects are initiated to improve manufacturing operations by turning data into actionable information that drives business results. The latest technology now provides unparalleled insight into manufacturing systems.

This in turn entices manufacturers to want to use this insight to drive improvements in line performance, line availability, overall quality, waste reduction, inventory management, changeovers, reduced impact of recalls, etc.

This approach improves preventive and corrective action decision-making because it's based on data instead of perception or "gut feel."

Yet many MI projects fall short of meeting expectations. These projects have to deliver the promised business improvements if they're to have long-term support within an organization. Often, however, MI projects provide manufacturers with reams of unusable data and little else.

This reality prompts the question: What can these manufacturers do to

extract maximum value out of their manufacturing data?

## Sort All That Data

Technological advances in automation, instrumentation and networking over the past several decades has resulted in a tremendous amount of diagnostic data being available for consumption. A typical manufacturing system easily can contain millions of data points.

Sorting through this data to determine how to best use it creates unique challenges, including:

**Data Overload.** With the massive amount of data available, having the time to sort through it to find what you need, when you need it, becomes a frustrating exercise that often results in abandoning the search and making a decision based on the limited information available.

**Untimely Data.** Looking at yesterday's data is not always conducive to improving today's operations. Historical data is useful for certain analysis and comparison of metrics, but real-time data that manufacturers can act upon when variances occur is more important.

**Lack of User-Based Data.** A manufacturing enterprise contains

various users who want to extract value from this data, including production, engineering, plant management, quality control, purchasing, corporate management, etc. And each user requires a unique view of the data.

For example, a plant manager might want to know the average cost per case being produced in near real time, while a maintenance manager might only want to look at one of the

## A well-thought-out plan should focus on how to convert manufacturing data into useful information.

variables making up the cost per case Key Performance Indicator (KPI), such as machine downtime.

### Lack of Context-Based Data.

For the above cost-per-case example, it would be beneficial to see this KPI trended along with other variables that might affect it, but that aren't part of the KPI calculation.

These can include product being run, shift, amount of overtime required and total energy usage in the plant.

**Inaccurate Data.** An additional challenge is reporting inaccurate data that typically leads to lack of user confidence in the data.

If the data can't be trusted, then there's no point in spending the time to look at it. Bad data is worse than no data.

Several potential causes for this exist, including manual data collection, poor configuration, mislabeling of data points and not understanding what makes up each data point.

## >> SOLUTION PROVIDERS

A select group of Rockwell Automation system integrators has achieved Solution Provider partnership status. This is a heightened and exclusive business relationship with Rockwell Automation. Solution Provider partners are proven, trusted and established organizations that offer extensive experience in the design, implementation, project management and maintenance of customers' industrial control systems.

**Discipline:** To earn Solution Provider (SP) partner status, integrators must possess high corporate standards, financial stability, proven methodologies and competency using Rockwell Automation technologies.

**Credibility:** SPs are well-established organizations that offer extensive experience in advanced automation solutions. They have been trusted advisers for their customers from initial design and consultation, system development, through the commissioning of comprehensive Rockwell Automation solutions.

**Expertise:** Whether your need is in design, project management, implementation or manufacturing systems maintenance, SPs possess the industry knowledge, domain expertise, resources and skills to deliver world-class solutions. Rockwell Automation recently expanded its Process Systems Integrator Program in 2009 with 45 new members.

With expertise in the metals, power generation and other process industries, the new program members will support the Rockwell Automation PlantPAX™ Process Automation System, bringing plant-wide control on a single platform to manufacturers looking to migrate their aging DCS systems. New program members also include 18 Latin American Solution Provider partners.

These process system integrators are reviewed for domain expertise, engineering excellence and geographic reach, among other criteria. They're selected for their abilities to help Rockwell Automation deliver value through the design, development and delivery phases of customers' projects.

For more information on the Rockwell Automation Process System Integrator Program and Solution Provider Program, visit [www.rockwellautomation.com/go/sitj](http://www.rockwellautomation.com/go/sitj).

### The Plan to Address Challenges

A well-thought-out plan to address such challenges is essential for delivering expected business results. The plan should focus on how to convert the data into useful information. But who determines what information is useful?

This in turn leads us to ask each manufacturer what information they require to enable better decision-making. This approach focuses the effort on the users' needs, not the endless data points available.

A typical plan might consist of the following steps:

1. Identify users and requirements for each user role.
2. Identify how each user will use the requested data to improve operations.
3. Identify KPIs required and standardize for apples-to-apples comparisons.
4. Identify data sources (PLCs, HMIs, Historians, ERP, CRM, WMS, LIM, etc.) to access.
5. Identify data presentation interfaces, such as dashboards, Web

# Rockwell Automation Solution Providers: Partners in delivering solutions

Best in class systems integrators providing industry and applications expertise in delivering automation and information solutions to manufacturing companies globally.

Proven, trusted, established organizations with extensive experience in design, implementation, project management and maintenance of your automation, control and process solutions.

Our Solution Providers deliver innovative results to keep your facilities operating efficiently.

pages, HMIs and smartphones, that best suit each user.

6. Select software solutions to collect, integrate and present the information.
7. Identify gaps in infrastructure and technology for achieving project goals.
8. Identify and execute pilots to test any areas of concern and provide users with a test drive.
9. Roll out across all manufacturing sites.

**User Requirements.** Representatives from each user group (i.e. operators, maintenance, quality, safety, plant management, corporate, IT, etc.) should be interviewed to determine what data can enable them to make better decisions in their day-to-day functions.

**How Data Will Be Used.** During the discovery period to determine user requirements, the focus is on how each information requirement will translate to improving the business. This ensures that everyone keeps the goal in mind at all times.

Once manufacturers understand and document each user requirement and improvement opportunity, they have a framework for what success means for their projects.

**Standardized KPIs.** KPIs provide a common benchmark for the plant's metrics and allow meaningful comparison of data. For example, having a different cost-per-case metric for each manufacturing system or plant causes confusion and doesn't allow effective comparison.

Getting everyone to speak a common language allows for better understanding and provides the framework for improvement.

KPIs also provide a leaner, more targeted view of the data. Drilling into each KPI then can provide detail

that supports that particular KPI calculation, with additional drill-down providing even more detail. This hierarchical organization of data allows easy access to the level of detail required, without losing sight of the bigger picture.

## Key Performance Indicators provide a leaner, more targeted view of manufacturing data.

**Data Sources.** Context-based information might require data to be pulled from various sources to provide comparative analysis. For instance, energy usage data is meaningful when compared to production information such as production counts and products run.

In addition, a cost-per-case metric, for example, might require data labor costs from the ERP system, production counts from the historian, parts costs from asset management and energy costs from an external source.

**Data Presentation.** Technology now allows the same information to be presented easily in a variety of interfaces, including Web pages, smartphones and large LCD displays.

Manufacturers should evaluate selected technologies for each data requirement and user group based on how each consumes information and reacts to it. Here are some examples:

- An IT manager might need text and e-mail alerts sent to their smartphone whenever a manufacturing server develops a critical error.
- Production personnel might prefer an overhead, large LCD

display that provides a manufacturing system overview with color-coded downtime blocks to indicate equipment status.

- A corporate manager could use a smartphone that displays the day's planned versus actual production counts for each plant. Color-coded indicators show status with drill-down capability to access more granular information that shows each production line's performance.

**Software Solutions.** MI software such as FactoryTalk® VantagePoint from Rockwell Automation (<http://bit.ly/4RdRov>) provides functionality that allows manufacturers to bring live data from multiple disparate sources to integrate and present data in meaningful ways.

The software provides a common interface to view and analyze the data without having to access different software interfaces separately for KPIs, such as cost per case that requires data from multiple systems.

In addition, FactoryTalk VantagePoint integration into Microsoft SharePoint allows for even greater access to business intelligence data and leverages SharePoint's core capabilities of collaboration, information sharing, content management, search, blogs, wikis and security.

**Gap Analysis.** Once the future state is identified, the present state should be evaluated to determine what infrastructure and technology gaps need to be addressed to access the desired data and present it as planned.

**Proof of Concept.** Prior to rolling out a full-scale deployment, test any areas of concern that could affect functionality delivered by the MI project. A pilot test typically is a small-scale implementation for this purpose. In addition, a pilot provides

manufacturers with a system test drive so they can obtain better feedback before rolling out the complete system.

This phased approach allows early adopters to understand the value that the system can deliver. Therefore, requirements that can provide the highest value typically are targeted for a pilot.

**Rollout.** Once pilots are complete and lessons learned are incorporated, a rollout strategy can be developed to deliver project requirements to all identified users. A continuous improvement plan should be part of the rollout to ensure the system continues to be optimized based on user feedback and as needs change. Ideally, the manufacturer assigns a champion to lead this effort.

### Driving Value

MI is a valuable tool for driving operational improvements. Understanding best practices, avoiding status-quo pitfalls, obtaining alignment from all stakeholders early in the project, and committing to a

## A continuous improvement plan should be part of the rollout.

disciplined plan for executing these projects will help ensure success and deliver the promised results to the business. In addition, FactoryTalk VantagePoint enables transformation of manufacturing data into actionable information and provides a platform for continuing this process. □

## Bridge the Communication Gap!

Migration to Rockwell Automation systems made easy!

As your equipment ages, you will eventually reach a point where your control systems will need to be upgraded to newer technology. In many cases, your migration strategy will occur in steps, with the new and old having to coexist in the same architecture. The Anybus X-gateway can bridge the communication gap between these systems. By providing data exchange over a wide range of fieldbuses and Industrial Ethernet, we can enable you to keep existing systems up and running as you bring new systems online.

- Bridge between EtherNet/IP, ControlNet & DeviceNet and most other popular networks
- Compatible with Rockwell Automation PLCs
- Easy installation - no programming required
- Over 200 versions available
- Designed for harsh industrial environments
